

(a) layered content

rain and snow cross static support, so those pixels are assigned to one region by flow alone

(b) stability without motion

Self-Forcing: fBD 2.40 is among the best static fidelity in the audit, yet MCFF-L 0.05 -- the intended motion has stopped too

(c) non-rigid drift

Self-Forcing: DLR 1.80 but DAR 0.00 -- the support moves, yet a rigid global model explains little of it, so it warps
